Hepatitis C Treatment Progress Report

Before & After Antiviral Therapy | Sample Progress Report for Medics Plan AI

1. Patient Information

Name	Age / Gender	Patient ID	Report No.
Ahmad Ali Khan	42 years / Male	MP-AI-2026-0847	HCV-TR-2026-0312
Doctor	Clinic	Report Date	Diagnosis
Dr. Sara Ahmed (Gastroenterologist)	Lahore Medical Center	25 July 2026	Chronic HCV Genotype 3

Clinical Diagnosis: Chronic Hepatitis C Virus Infection (Genotype 3). Treatment with Direct-Acting Antivirals (DAAs).

2. Pre-Treatment Report (Baseline)

Date: 10 April 2026 | Status: Before starting antiviral therapy

Test	Result	Reference Range	Status
HCV RNA Viral Load	1,850,000 IU/mL	Not Detected	Very High ↑
ALT (SGPT)	128 U/L	7 - 56 U/L	Elevated ↑
AST (SGOT)	95 U/L	5 - 40 U/L	Elevated ↑
Total Bilirubin	1.4 mg/dL	0.1 - 1.2 mg/dL	Slightly High
Albumin	3.6 g/dL	3.5 - 5.0 g/dL	Normal
Platelet Count	142,000 /μL	150,000 - 450,000	Low ↓

3. Prescribed Treatment

Regimen: Sofosbuvir 400 mg + Daclatasvir 60 mg — once daily for 12 weeks (can be taken with or without food).

This is a standard Direct-Acting Antiviral (DAA) combination highly effective for HCV Genotype 3.

4. Post-Treatment Report (SVR12)

Date: 15 July 2026 | 12 weeks after end of treatment (Sustained Virologic Response)

Test	Result	Reference Range	Status
HCV RNA Viral Load	Not Detected (<15 IU/mL)	Not Detected	Cleared ✓
ALT (SGPT)	28 U/L	7 - 56 U/L	Normal ✓
AST (SGOT)	22 U/L	5 - 40 U/L	Normal ✓
Total Bilirubin	0.7 mg/dL	0.1 - 1.2 mg/dL	Normal ✓
Albumin	4.1 g/dL	3.5 - 5.0 g/dL	Normal ✓
Platelet Count	178,000 /μL	150,000 - 450,000	Normal ✓

5. Comparison & Outcome

Parameter	Before	After	Change
-----------	--------	-------	--------

Viral Load	1.85 million IU/mL	Not Detected	Complete Clearance ✓
ALT	128 U/L	28 U/L	78% reduction
AST	95 U/L	22 U/L	77% reduction

OUTCOME: Sustained Virologic Response (SVR12) achieved. Patient is successfully cured of Hepatitis C.

6. Explanation of this Report

What is this report? This is a sample treatment progress report generated by the Medics Plan AI platform. It shows how the system tracks a patient’s Hepatitis C treatment from start to finish.

Why two reports (Before & After)? • Baseline (Before): Taken before starting medicine to measure how much virus is in the blood (Viral Load) and how much the liver is affected (ALT, AST). • SVR12 (After): Taken 12 weeks after finishing the 12-week course of medicine. If the virus is no longer detectable, the patient is considered cured.

What do the key tests mean? • HCV RNA Viral Load: Amount of Hepatitis C virus in the blood. Goal is “Not Detected”. • ALT / AST: Liver enzymes. High levels mean liver inflammation. They should return to normal after successful treatment. • Platelets & Albumin: Reflect overall liver health and function.

About the medicine: Sofosbuvir + Daclatasvir is a modern Direct-Acting Antiviral (DAA) combination. It is taken once daily for 12 weeks and can be taken with or without food. Cure rates for Genotype 3 are typically above 95%.

Role of Medics Plan AI: The platform sits between the doctor and the patient. It securely stores reports, highlights changes, sends reminders, and explains complex medical data in simple language so both the doctor and the patient can clearly see the progress. This kind of system is commonly called a Patient Portal, Telemedicine / Care Coordination Platform, or AI Medical Assistant.

Key Takeaway for your project: Medics Plan AI can automatically generate clear before/after medical reports like this one, compare results, flag improvements, and present them to both the doctor and the patient in an easy-to-understand format.
